

Feasibility Study in Project Management

Blink Sakulkueakulsuk

Feasibility Study/Feasibility Analysis

- Feasible = possible to do easily or conveniently.
- Feasibility Study
 - An **assessment** of the **practicality** of a project or system
 - It evaluates the project's **potential for success** through many aspects

The 5 Aspects: TELOS + S

Generally, a feasibility study focuses on the following 5 aspects + 1 “special” aspect

SUSTAINABLE DEVELOPMENT GOALS

The 5+1 Aspects: TELOS + S

Main questions to answer:

Technological Feasibility

Is the project technically possible?

Economic Feasibility

Can the project be afforded? Worth it?

Legal Feasibility

How can legal limitations affect?

Operational Feasibility

How will the current operation be affected?

Schedule Feasibility

Can the project be done in time?

Sustainable Feasibility

Is the project sustainable?

Technological Feasibility

It aims to assess if the plan of the project is **technically possible**

- Study of technical resources (man and machine)
- Evaluation of hardware and software requirements

There are many factors involved in the study. But this is basically the study to answer the following question:

Does our team have the technical experts and technology to complete the project? How so?

Technological Feasibility

Guiding Questions

- Is the project **technically possible**?
 - Proof of concepts, Prototype
- Do you have **access** to the technology?
- Are your team **capable** of utilizing the technology?
- Are stakeholders and users **capable** and **willing** to use them?
- How much **time and money** do you need if you use this technology?

Economic Feasibility

It aims to assess if the plan of the project is **economically possible**

- Study of economic conditions of the project team and the market
- Cost Benefit Analysis

There are many factors involved in the study. But this is basically the study to answer the following question:

Does our team have the funding to complete the project? How so?

Is the project worth to be used? How so?

Economic Feasibility

Guiding Questions

- Where is your **funding** from?
- Do you have financial **supports from decision makers**?
- Is the project **financially attractive**?
- Do you have any **financial constraints**?

Legal Feasibility

It aims to assess if the plan of the project is **legally possible**

This is the easy (kind of) one to analyze. This is also the study to answer the following question:

Is the project legal?

Legal Feasibility

Guiding Question

- Is your project **break any law** or conflict with any policy?
- Does your project **violate any agreements**?
- Does your project have any problem involving **intellectual property**?
- Is there potential of success/failure based on **pending legislation**?

Operational Feasibility

It aims to assess if the plan of the project is **operationally possible**

This is a hard one to analyze. But this is basically the study to answer the following question:

- During the project, does our team has the existing environment to support the project?
- After completing the project, will the project be used? How well is the project going to solve the problem?

Operational Feasibility

Guiding Question

- What **training** will people need?
- What **changes to the team** do you need?
 - Working process
 - Members
- What impacts will the project affect **other ongoing works**?

Schedule Feasibility

It aims to assess if the plan of the project is **possible to be complete in time**

This is a (kind of) easy one to analyze. This is basically the study to answer the following question:

- What are the plan/schedule/timeline of our project?

Schedule Feasibility

Guiding Question

- Will you be able to complete and deliver in time?
- Is there any potential scheduling conflicts?
- How do you ensure to meet the deadline?

Sustainable Feasibility

It aims to assess if the project is sustainable or aligns with SDG goals/target.

This is an important aspect to analyze, especially in the current world stage.

Sustainable Feasibility

Guiding Question

- Does the project align with SDG goals or targets?
- Does the project cover more than 1 level of SDG layer?

This studio . . .

You should **NOT** focus on only Technological Feasibility

This studio . . .

You should **NOT** focus on only Technological Feasibility

You do **NOT** have to analyze each aspect separately. You will find that all aspects affect the others.

Good Luck Analyzing!
